STEAP is a member of cell surface serpentine transmembrane antigens. STEAP 2 gene is located on chromosome 7q21 and is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP protein with a cancer that expresses STEAP, or in a patient, comprises administering a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expresses STEAP, or comprises the variable domains of the heavy and light chain is for the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody coding that the vaccional antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody coding antibody is expressed intracellularly. Note: This sequence is stated to be the same as that being shown as SEQ ID NO:8 (AABC2841) in sequence listing of the specification. However both the sequences differ at

New polynucleotide for the diagnosis, prevention and treatment prostate and testis disorders, particularly prostate cancer, coprostate-specific or testis-specific nucleic acids. comprises

Claim 1; Fig 4H; 114pp; English.

The invention relates to substantially pure prostate-specific or testisCC specific polypeptides and the nucleic acids encoding them. Also included
CC are vectors and host cells expressing the proteins, a transgenic animal
CC expressing the protein, antibodies against the proteins, probes for
CC detecting the nucleic acids, antisense molecules for the nucleic acids
CC and methods of isolating modulators of the proteins. Compounds that
CC modulate the prostate specific or testis specific polypeptide are useful
CC to diagnose, prevent or treat disorders of the testis or prostate
CC prostatilis, testicular cancer, cryptorchidism, undescended, retractile,
CC ascending or vanished testis. Other proliferative disorders for which the
CC accer, breast cancer, pancreatic cancer, liver cancer and lung cancer.
CC The present sequence is prostate specific protein, Six-Transmembrane
CC Protein of Prostate 1, STMP1, ORF2

The present invention relates to methods of detecting a prostate cancer-
associated transcript in a cell from a patient. The method comprises
contacting a biological sample from the patient with prostate cancer-
                                                                                                                                                                                                                                                                                                                          Gish

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

ABG61800-ABG61944 represent prostate cancer-associated proteins

The invention relates to an isolated tumour-associated antigenic target colypeptide (TAT) (I), specifically TAT134 TAT138 polypeptides, and the polypucleotides (II) encoding them. (II) is useful for diagnosing the presence of a tumour in a mammal, where the level of expression of (II) is indicative on the presence of tumour in the mammal from which the test sample was obtained. Antibody to (I) is useful for killing a cancer cell, sample was obtained. Antibody to (I) is useful for killing a cancer cell, a colorect all cancer cell, a lung cancer cell, a novarian cancer cell, a central nervous system (CNS) cancer cell, a liver cancer cell, a bladder cancer cell, a pancreatic cancer cell, a colliver cancer cell, a bladder cancer cell, a pancreatic cancer cell, a colliponucleotide probes or for encoding fragments of full length TAT colliponucleotide probes or for encoding fragments of full length TAT colliponucleotide probes or for encoding fragments of full length TAT colliponucleotide probes for mapping the gene encoding TAT and for genetic canalysis of individuals with genetic disorders. (II) is also useful for generating either transgenic animals or knockout animals, and in gene therapy. The TAT polypeptides and nucleic acids may also be used for tissue typing and the TAT polypeptides are useful for staging TAT collypeptide (agonist) or prevent the effect of TAT collypeptide (agonist) or prevent the effect of TAT collypeptide (agonist) is useful for staging TAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Goddard F

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptide-expressing cancers, purifying or immunoprecipitating TAT polypeptide from cells, for detection and quantitation of TAT polypeptide in vitro, e.g., in an enzyme linked immunosorbent assay (ELISA) or Western blot. The antibodies are also useful for treating a TAT-expressing cancer or alleviating one or more symptoms of cancer in a mammal. The present sequence represents the amino acid sequence of TAT138

```

The invention discloses human nucleic acids encoding tumour-associated antigenic target (TAT) polypeptides, with or without their associated signal peptide. Also disclosed is an antibody that specifically binds to the TAT polypeptides, a method for detecting the presence of a tumour in a mammal and a method for killing a cancer cell expressing the TAT polypeptide. The nucleotide sequences are useful in preparing TAT polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The TAT polypeptides are useful as therapeutic agents and for detecting the presence, prevention and/or treatment of a tumour, such as colon, breast or prostate tumour. The TAT polypeptides and nucleic acids may also be used diagnostically for tissue

New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or of gene therapy.

Claim 1; Page; 222pp; English.

The invention discloses a polynucleotide comprising a sequence selected CC from 1970 fully defined nucleotide sequences which encode novel CC polypeptides. Also claimed is a polypeptide encoded by the polypucleotide CC or its partial peptide, an antibody binding to the polypeptide or peptide CC of the polynucleotide, immunologically assaying the polypeptide or peptide of the polynucleotide by contacting the polypeptide or peptide CC with the antibody of the encoded protein, and observing the binding CC between the two, a transformant carrying the polynucleotide in an CC expressible manner and an antisense polynucleotide. The oligonucleotide carposesible manner and an antisense polynucleotide, or as a probe CC for detecting the polynucleotide. The polynucleotide, or as a probe CC for detecting the polynucleotide. The polynucleotide and encoded CC genes may be included in them, for developing a diagnostic marker or CC medicines for regulation of their expression and activity, or as targets CC gene therapy. The genes are involved in tissue and/or cell CC transcription-related proteins, signal transduction-related proteins, CC transcription-related proteins, disease-related proteins and genes cencoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate CC sequence presented is a protein of the encoded protein to treat diseases. The sequence data for this patent is not represented in the printed by the sequence data for this patent is not represented in the printed by the European Patent Office.

                                                                                                                                                                                                                                                                                                                                   The invention relates to six-transmembrane epithelial antigen of the prostate related protein (STEAPRP) and its corresponding nucleic acid. STEAPRP DNA is used to diagnose and to treat prostate cell proliferative disorders, particularly prostate hyperplasia and prostate cancer, and for screening a library of molecules of compounds for specific binding affinity. It is also used in gene therapy. STEAPRP is used to screen a subject sample for antibodies, which specifically binds the protein, and to prepare and purify a protein. The present sequence is human STEAPRP
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim

cc useful for detecting expression of the protein in a sample, where the sample is lung or prostate tissue sample and the protein is diagnostic differentially expressed when compared with a standard and is diagnostic confaring everal molecules and compounds to identify an antibody that specifically binds the protein. The protein is useful for coreening several molecules and compounds to identify at least one ligand. The protein is also useful for preparing and purifying a polyclonal antibody and for preparing a monoclonal antibody using standard animal immunisation/hybridoma methods. A TMPL specific antibody is useful to detect expression of the protein in a lung or prostate tissue sample and the method is useful as a diagnostic for lung or prostate cancer. A TMPL specific antibody is also useful for immunopurifying a protein, for treating a prostate cancer and for delivering a therapeutic agent to a cancer, preferably prostate cancer. The protein is useful for diagnosing, staging, treating or monitoring progression or treatment of cancer, preferably lung or prostate cancer. The present sequence represents the amino acid sequence of the human

                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to substantially pure prostate-specific or testis-
CC specific polypeptides and the nucleic acids encoding them. Also included
CR are vectors and host cells expressing the proteins, a transgenic animal
CR expressing the protein, antibodies against the proteins, probes for
CR detecting the nucleic acids, antieense molecules for the nucleic acids
CR and methods of isolating modulators of the proteins. Compounds that
CR condulate the prostate specific or testis specific polypeptide are useful
CR to diagnose, prevent or treat disorders of the testis or prostate
CR controllarly prostate cancer, benign prostatic hyperplasia, acute
CR controllarly prostate cancer, benign prostatic hyperplasia, acute
CR controllarly or vanished testis. Other proliferative disorders for which the
CR cancer, breast cancer, pancreatic cancer, leukaemia, melanoma, ovarian
CR cancer, breast cancer, pancreatic cancer, leukaemia, melanoma, ovarian
CR cresent sequence represents a prostate specific protein, Six-
CR Transmembrane Protein of Prostate 1, STM,1

                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to substantially pure prostate-specific or testis-
CC specific polypeptides and the nucleic acids encoding them. Also included
CC are vectors and host cells expressing the proteins, a transgenic animal
CC expressing the protein, antibodies against the proteins, probes for
CC detecting the nucleic acids, antisense molecules for the nucleic acids
CC and methods of isolating modulators of the proteins. Compounds that
CC to diagnose, prevent or treat disorders of the testis or prostate
CC particularly prostate cancer, benign prostatic hyperplasia, acute
CC prostaticis, testicular cancer, cryptorchidism, undescended, retractile,
CC ascending or vanished testis. Other proliferative disorders for which the
CC modulators may be used include lymphoma, leukaemia, melanoma, ovarian
CC cancer, breast cancer, pancreatic cancer, leukaemia, melanoma, ovarian
CC The present sequence is prostate specific protein, Six-Transmembrane
CC Protein of Prostate 1, STM;1, ORF3
                                                                                                                                                                                                                                                    Query Match

sequences. (I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used CC in diagnostics as expressed sequence tags for identifying expressed cC genes. (I) is useful in gene therapy techniques to restore normal CC activity of (II) or to treat disease states involving (II). (II) is CC useful for generating antibodies against it, detecting or quantitating a polyment. (II) and its binding partners are useful for medical imaging CC of sites expressing (II). (I) and (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The CC polypeptide and polymucleotide sequences have applications in

ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations production professity.

YX New isolated polynucleotide and encoded polynucleotide (I) and polypeptide (II) diagnostics, forensics, gene mapping, identification of mutations production professity.

XX Claim 20; SEQ ID NO 30472; 103pp; English.

XX Claim 20; SEQ ID NO 30472; 103pp; English.

XX Claim 20; SEQ ID NO 30472; 103pp; English.

XX The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, coligomers, and for chromeome and gene mapping, can din recombinant production of (II). The polynucleotides are also used genes. (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving expressed genes. (I) is useful in gene therapy techniques to restore normal capturer of (II) or to to treat disease states involving of (II). (II) is useful for generating antibodies against it, detecting or quantitating a cuplement. (II) and tis binding partners are useful in medical imaging complement. (II) and tis binding partners are useful in medical imaging complement of the protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in collapostics, forensics, gene mapping, identification of mutations responsible for genetic dissorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and can decide sequences. ABG00010-ABG03077 represent novel human diagnostic captured format diagnostic captured format diagnostic captured format diagnostic captured by the product dependent on DNA and captured format diagnostic captured by the sequence of the invention. Note: The sequence data for this general profess of the invention of the product data for this general profess of

ID AAE02
located on chromosome 7q21 and is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP in a patient, comprises administering a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, comprises administering to the patient a vector encoding single chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody is expressed intracellularly. Note: This sequence is stated to be the same as that being shown as SEQ ID NO:8 (AREO.781) in figure 9A-9C
Sequence
                                                                                                                                                                                                                                     The present sequence is an alternative version of human six transmembrane epithelial antigen of the prostate (STEAP)-2 protein. STEAP is a member of cell surface serpentine transmembrane antigens. STEAP-2 gene is
                                                                                                                                                                                                                                                                                             Claim 1;

(II) and (III) are useful for diagnostic evaluation of disorders. (I) is useful for gene therapy of diseases and (II) can be used for therappeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's, Parkinson's, Huntington's and amylotrophic lateral sclerosis), immune deficiencies, cancer, autoimmune disorders, multiple sclerosis, diabetes and allergies. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
